

Petcocks

Chopper Fuel Tank Selector. The idea behind the Selector is the option of mounting the fuel valve at any desired location. Where the fuel tank bottom shows, this device will keep the fuel tank bottom clear from hoses or petcock, also most stretched fuel tanks, and chopper tanks, are usually raised up the front section and installing petcock in front or middle part of the tank, will not allow to drain or use all the gas in the tank. The Selector needs two hoses coming from the gas tank one for "ON" position and the other for "RESERVE", hoses can come from the very end of the fuel tank, allowing you to use 100% of fuel capacity.
